13) Implicit Association Test (IAT).
   This link provides information about the IAT.

   **How does the IAT measure implicit attitudes and stereotypes?**
   The Implicit Association Test (IAT) measures the strength of associations between concepts (e.g., black people, gay people) and evaluations (e.g., good, bad) or stereotypes (e.g., athletic, clumsy). The main idea is that making a response is easier when closely related items share the same response key. We would say that one has an implicit preference for straight people relative to gay people if they are faster to complete the task when Straight People + Good / Gay People + Bad are paired together compared to when Gay People + Good / Straight People + Bad are paired together.

   Click on this link to take a test.   Please read the instructions carefully.  The last line reads: "I am aware of the possibility of encountering interpretations of my IAT test performance with which I may not agree. Knowing this, I wish to proceed ".  Once you click "I wish to proceed", a list of tests that will appear. You will need to click on the blue tab to go to a test.  Each test takes about 10 minutes to complete.
